

✦ Efficiency Transformation

Efficiency Transformation with RA+

From internal productivity to scalable revenue and in-product efficiency advisory. Transform expert knowledge into scalable product value.

Explore the Strategy

Scroll to explore

What's Happening ⁰¹

Proven CoE and Bureau capacity, ready to become a digital overlay

The Efficiency CoE, Consulting practice, and Global Energy Bureau already deliver trusted advisory, IDM, auditing, implementation, and ongoing monitoring across public and private sectors (38 people, 428 clients, 195K connected meters, \$75M in performance guarantees). The opportunity is to turn that human capacity into a digital overlay on top of RA+, so the same expertise enriches IDM, informs Sera, and reaches more customers without scaling the team linearly.

The True Problem ⁰²

The issue is connection, not demand

Data, context, and execution do not flow through one system. IDM holds WAGES and asset telemetry. Consulting and Bureau hold the engineering context, audit findings, and lifecycle knowledge. Customer workflows live in slides, trackers, and email. Sustainability teams cannot prioritize portfolios with confidence, efficiency teams cannot explain KPIs in context, and customers cannot see why an action is recommended or whether it was validated.

Our North Star ⁰³

A connected intelligence system on the RA+ spine

IDM becomes the trusted foundation for WAGES and contextual data, enriched continuously by Consulting and Bureau work product. Sera is the interface that turns that combined data and context into prioritization, explainable insights, structured execution, and closed-loop validation, with the same underlying data used to verify outcomes. Asset Planning sits adjacent; the Energy Manager experience leads the sequence.

A Pragmatic Way to Win ⁰⁴

Connect IDM, expert context, and Sera one workflow at a time

Finalize the unified efficiency taxonomy, capture audit and Bureau findings as first-class data inside IDM, and wire Sera into the recurring questions efficiency teams already answer. Start with prioritization and KPI explainability, then layer ECM detection (with engineering judgment and site validation always required), structured execution tied to specific assets, and closed-loop validation using the same data that surfaced the opportunity.

Economic Impact ⁰⁵

Productivity for our teams, clarity for customers, stickier RA+

Connecting data, context, and execution reduces rework across Consulting and Bureau, makes recurring customer questions answerable inside the platform, and creates pull for deeper engagements when the

system surfaces opportunities customers want to act on. The same data carries through from detection to verification.

Less

REWORK ACROSS TEAMS

Clearer

CUSTOMER PRIORITIZATION

Stickier

RA+ VALUE PROPOSITION

Strategic Upside ⁰⁶

An explainable, closed-loop operating model

The end state is a connected system that links data, context, and outcomes across Strategy, Building View, audit workflows, and customer-facing guidance. Customers see why an action is recommended, what evidence supports it, and whether it was verified. Expert services are pulled in for validation, interpretation, and complex calls, never as the only way to get value from the platform.

⁰⁷

Risks & Mitigations

Two cross-cutting risks live here. Operating rules are detailed in [Guardrails](#) and boundaries in [Out of Scope](#).

Customer context is too thin for useful recommendations

Efficiency guidance becomes inconsistent across teams

→ Start with data-light guidance, show data gaps transparently, and progressively enrich with site, audit, AkitaBox, BMS, and customer inputs.

→ Govern taxonomy, required fields, calculation assumptions, and SME review so the library becomes the single source of truth.

@ STRATEGIC CONTEXT

Our biggest efficiency lever is unlocking the knowledge and data we already own

Decades of ECM audit IP sit locked inside slide decks, and interval data sits stranded in IDM 1.0 disconnected from the rest of the workflow. RA+ users wait for full audit cycles to see what efficiency moves are possible. The leverage is in turning that knowledge into a living, in-product engine and re-platforming IDM into RA+ as its agent-ready data spine.

Weeks to Days

90%+

IDM 2.0

ECM Scoping Cycle

Compress manual ECM scoping from weeks of expert time to days of guided drafting

Audit IP Reused

Legacy ECM deliverables reactivated as structured, searchable evidence

Interval Data Spine

Re-platformed inside RA+ as the agent-ready context layer that blends telemetry with field and consultancy work product

Always-On

IDM-Driven Discovery

Interval data continuously surfaces staging, compressed air, and control ECMs without waiting for a full audit

1 Spine

Unified Building Data

Shared across discovery, scoping, proposals, and in-product guidance

🚀 OUR NORTH STAR

Turn decades of ECM audit IP and interval data into a living, in-product efficiency engine inside RA+, with IDM 2.0 as the agent-ready spine, so every customer sees credible, calibrated efficiency opportunities without waiting for a full audit cycle.

MARKET CONTEXT

Forces Shaping Customer Needs

Customers face the most demanding efficiency landscape in a generation. These pressures define where the Efficiency CoE and RA+ must deliver.

Rising Energy Costs & Volatility

Customers face unpredictable utility bills and capacity charges, putting efficiency back at the top of the operating agenda.

Decarbonization Pressure

Scope 1 and 2 commitments turn efficiency from a nice-to-have into a measurable contribution to corporate climate targets.

Aging Building Stock

Portfolios mix legacy HVAC, controls, and envelopes, creating broad ECM opportunity but also high diagnostic complexity.

AI & Self-Service Expectations

Energy Managers expect guided, in-product recommendations, not static

Audit & Incentive Programs

Utility rebates, tax credits, and disclosure mandates reward customers

Operational Resilience

Efficiency is increasingly tied to resilience and uptime, not only cost,

reports delivered weeks after data is collected.

who can show calibrated, evidence-backed ECM plans.

raising the bar on data quality and traceability.

Interval Data Everywhere

Sub-hourly meter and submeter data is now standard, but legacy IDM workflows leave it stranded. Customers expect it live inside the efficiency product, not exported to spreadsheets.

Agent-Ready Data Expectations

Buyers assume telemetry, asset context, and audit IP are unified so agents like Sera can reason over them. IDM 2.0 is what makes that real inside RA+.

THE PROBLEM

Key Challenges

Efficiency value today is bottlenecked by knowledge sitting in slides, manual scoping, and deliverables that do not connect back to the RA+ data spine.

Knowledge Fragmentation

- Decades of audit IP locked inside PowerPoint deliverables that are hard to search or reuse
- ECM measures, assumptions, and savings logic are scattered across consultants and engagements
- Every new audit starts from a near-blank page instead of building on prior evidence

Manual Audit Workflows

- ECM scoping is slow, expert-bound, and hard to scale beyond a handful of senior auditors
- Templated calculations and sensitivity sweeps are redone by hand on every engagement
- Capacity to serve more clients is capped by available expert time, not by opportunity

Opportunity Latency

- Customers wait for a full audit cycle to learn what efficiency moves are possible
- Early advisory is delivered late and does not scale beyond individual consultants
- RA+ users see operational data but no in-product efficiency recommendations

Disconnected Deliverables

- Slide-driven outputs require manual assembly and break the link to underlying data
- M&V results rarely feed back into future recommendations or scoping logic
- No shared building data spine across discovery, scoping, proposals, and follow-up

IDM 1.0 Stranded

- Interval data lives in a standalone IDM tool, disconnected from the RA+ efficiency workflow

No Agent-Ready Spine

- Telemetry, asset context, and audit IP live in separate systems with no shared semantics

- Field and consultancy work product never reaches the same layer telemetry sits in
- Sera and downstream agents cannot reason over IDM data because it is not agent-ready

- Each engagement re-stitches data instead of pulling from a governed building spine
- Self-serve, hybrid, and fully serviced clients cannot be supported on the same data foundation

1000s

Legacy audit deliverables waiting to be reactivated

Weeks

Typical time to first ECM proposal today

1 IDM

Standalone tool today, re-platformed as the RA+ data spine

1 spine

Unified building data target across every service line

How Customer Pain Translates Into Engagement

Three recurring signals from customers, three integrated responses from the Efficiency CoE and RA+.

"Our energy bills keep climbing and we cannot tell which sites are worst"

- Portfolio-wide ECM screening grounded in IDM 2.0 interval data, surfacing the highest-impact sites and measures first.

"We have to hit our carbon targets and need credible efficiency moves"

- Calibrated ECM recommendations tied to verified savings logic, ready to feed Scope 2 and CSRD-aligned reporting.

"We do not trust the numbers in our last audit report"

- Transparent assumptions, reusable audit IP, and M&V feedback loops grounded in IDM-grade interval data that make every recommendation traceable.

"Our interval data sits in IDM and never reaches the people making decisions"

- IDM 2.0 re-platformed inside RA+ so telemetry, asset context, and audit IP flow into the same workflow Energy Managers and Sera already use.

"We want to run our own analyses, not wait for a consultant every time"

- Give Me, Help Me, Do It For Me profiles on one IDM-powered platform, so clients can self-serve, co-pilot, or stay fully serviced as they mature.

THE VISION · POWERED BY RA+

What if you could, **tomorrow...**

With IDM 2.0 as the interval-data and context spine inside RA+, Efficiency Transformation reshapes how efficiency teams work and how customers experience value

Prioritize across the portfolio

Walk into a customer meeting with a clear view of where to act first across sites, systems, and portfolios, grounded in IDM 2.0 data plus the context Consulting and Bureau already hold

Explain every KPI in context

Move from static audit decks to explainable readouts where each KPI links back to the data, assumptions, and engineering context that produced it

One connected spine for data and context

Capture WAGES, asset telemetry, audit findings, and Bureau insights once on the RA+ spine and reuse them across recommendations, execution, and verification

Answer recurring customer questions inside the platform

Resolve the recurring questions efficiency teams answer today (anomalies, baselines, what changed, what to do next) inside Sera, with experts pulled in when judgment is required

Carry ECMs through their full lifecycle

Structure ECMs as a lifecycle (detect, feasibility, design, constructability, implementation, verification) where the platform carries the data and engineering context from one stage to the next

Efficiency Transformation with RA+

RA Classic treats IDM as a separate module bolted to the side of the platform. RA+ re-platforms IDM 2.0 as a native, agent-ready data spine. This is the opportunity to build a SaaS solution for Efficiency services, not migrate a module.

RA Classic: The Module

ISOLATED BY DESIGN

- ✗ IDM 1.0 lives as a standalone module, separate from the rest of RA
- ✗ Separate hierarchy (PAM vs RA), separate filters that do not work together
- ✗ Separate reports with a 5-step bridge to standard RA
- ✗ Corrected interval data does not persist back into the platform
- ✗ 200+ integration sources, but interval data stays siloed inside IDM
- ✗ Field and consultancy work product never reaches the IDM layer

RA+: The Platform

INTEGRATED BY DESIGN

- ✓ IDM 2.0 re-platformed inside RA+ as the agent-ready context layer
- ✓ One unified data model across all products, with interval data as a first-class citizen
- ✓ Interval data live in dashboards, reports, and emissions natively, no module hop
- ✓ Telemetry blended with asset, ECM, and audit context that Sera can reason over
- ✓ Sera as the primary interface from day one across all engagement profiles
- ✓ Self-serve onboarding, no spreadsheets, no IDM export and re-import loop
- ✓ ECM digitization via existing sustainability surfaces, fed by the IDM spine

Every pain point from RA Classic stems from IDM living as a module. RA+ eliminates that architecture by turning IDM 2.0

into the spine the whole efficiency workflow runs on.

What the Bureau Delivers Today

38 people, 428 clients, \$8 to 10M per year, 195K connected meters

FOUNDATION

Resource Advisor IDM

Data ingestion, quality management, dashboards, alerts. 195K connected meters across 200+ integration source types. Today a standalone module, re-platformed in Phase 1 as IDM 2.0 inside RA+.

ACCELERATOR

Energy Performance Services

ECM identification, savings analysis, optimization recommendations. \$75M in active energy guarantees (\$1B+ total). Powered by the same IDM spine, surfaced through Sera.

FEEDBACK LOOP

Measurement and Verification

Audit-grade evidence that closes the loop between recommendation and outcome, with M&V results flowing back into the IDM-backed context layer.

RA+ digitizes all three on a single IDM 2.0 spine. The data platform replaces manual IDM workflows. Sera automates EPS analysis. M&V becomes a platform capability. Reach expands from 428 Bureau-served clients to the broader RA+ installed base, supporting Give Me, Help Me, and Do It For Me engagement profiles on the same data foundation.

In Scope vs Adjacent: Energy Efficiency vs Asset Planning

RA+ organizes interval data capabilities into two separately-sold products within the Efficiency family. This playbook covers Energy Efficiency. Asset Planning is a separate discovery.

Energy Efficiency

THIS DISCOVERY

The daily-use product. Monitoring, analysis, alerting, data quality, meter management, and operational optimization.

- ✓ Real-time and near-real-time energy monitoring
- ✓ Anomaly detection and proactive alerting
- ✓ Interval data analysis (trend, load profile, heatmap, comparison, Sankey)
- ✓ Data quality: completeness, gap detection, correction, audit trails
- ✓ Meter and source onboarding (self-serve)
- ✓ Unified data model integration with RA+ platform
- ✓ Schedule management and segmentation
- ✓ Action tracking and workflow support

Asset Planning

SEPARATE DISCOVERY

The project-oriented product. Baseline modeling, M&V, savings verification, capital investment planning, and project portfolio tracking.

- ✓ Baseline modeling (IPMVP Option C/D)
- ✓ Measurement and Verification (CUSUM, savings quantification)
- ✓ Project tagging, tracking, and savings reporting
- ✓ Capital asset lifecycle planning
- ✓ Dollar/unit savings analysis
- ✓ Schneider PASS Analytics

These products are sold separately, but they build on each other. The platform must ensure the boundary between them is a licensing boundary, not a technical one.

STRATEGIC CONTEXT

Why Now

From external pressure and internal confusion to structured value, scale, and measurable impact

PRESSURE

6

Customers expect earlier and clearer efficiency guidance

Enterprise AI mandates push customers to adopt AI-driven energy decisions in 2026

ISO 50001 certification cycles are creating concrete buying pressure

AI bypass risk: customers like Tetra Pak are evaluating in-house AI on their own data

Competitor movement accelerating

CONFUSION

3

Customers cannot access credible guidance without a full audit

No central system of record for efficiency knowledge and assumptions

Efficiency workflows are disconnected from the product

STRUCTURE

4

Provisional opportunity knowledge base now, enriched via past-audit pipeline

Create the connection from shared guidance to Strategy, Building View, and the Energy Efficiency product

Single governed efficiency knowledge base with taxonomy, required fields, and versions

Lock shared language & assumptions (inputs, "From→To", typical ranges) to remove variance

VALUE

4

Top-down: goal-based efficiency guidance inside Strategy so customers get value before a full audit

Bottom-up: building-level opportunity relevance so customers explore by place, not just targets

Explainability & guardrails so early advice is credible and upsells to deeper expert advisory work when needed

Dedicated Energy Efficiency product with end-to-end workflows

SCALE

5

Customers receive faster, more consistent guidance through one governed source

The same efficiency intelligence can be reused across Strategy, Building View, regions, and sectors

Integration with RA+, IDM, AkitaBox etc.

Internal expertise is leveraged at scale rather than repeated manually

This foundation supports the future Energy

IMPACT

5

Better customer decisions and higher adoption

Customers achieve measurable emissions, energy & cost reductions

Schneider E. gains stronger credibility and trust

Stickier RA+ recurring revenue

Efficiency team gets audit upsell from early insight, becomes more productive due to digitisation

digital efficiency
advisory

Internal scaling
limits (manual
audits,

and engineers

Efficiency
product

PERSONAS

Four Roles, One Design Sequence

Four roles interact with Energy Efficiency. We design for all of them, but in a deliberate sequence: the Energy Manager's daily experience drives the primary UX.

Energy / Facility Manager

PRIMARY

Daily operator, client-side, 1 to 10 sites

The person closest to the buildings. Checks RA+ every morning. Operates in two modes: daily monitoring and analytical investigation. Both modes are Sera-driven.

Data Operations Analyst

SECONDARY

SE internal or client power-user, 10 to 100+ sites

Onboards new meters, fixes gaps, manages hierarchies. In RA Classic this role absorbs enormous administrative overhead. In RA+ this role should shrink dramatically.

- Spot energy waste before it costs money
- Prove that efficiency projects deliver savings
- Trust that the numbers on screen are accurate
- Share a savings report with leadership without help
- Understand why something happened, not just that it happened
- Find patterns worth acting on across the portfolio

- Onboard new meters in minutes, not days
- Know where data gaps exist and fix them fast
- Trust that interval data flows into reports without manual bridges
- Manage 100 sites without touching spreadsheets

Sustainability / ESG Lead

TERTIARY

Client-side, portfolio level, 50 to 500+ sites

Cares about interval data only insofar as it feeds compliance reporting, Scope 1/2 targets, and portfolio benchmarks. Needs the numbers right and reports auditable.

- Interval data feeds ESG reports without manual aggregation
- Portfolio benchmarks include interval-granularity sites
- Audit trail proves data provenance for compliance
- One reporting surface for all data types

Executive / VP of Energy

INFORM

Client-side, consumes outcomes only

Receives dashboards and summary reports. Never interacts with interval data directly but makes investment decisions based on the insights it enables.

- See verified savings against targets
- Confidence that reported numbers are trustworthy
- One dashboard covering the full portfolio
- Actionable insights, not raw data

Design sequence principle. Design the Energy Manager's experience first. It is the highest-frequency, highest-emotional-stakes interaction. Both modes (daily monitoring and analytical investigation) are Sera-driven. Data Ops Analyst configuration tools are layered behind through progressive disclosure. Sustainability Lead and Executive consume interval insights through existing RA+ reporting and dashboarding surfaces.

What Users Hire Energy Efficiency to Do

The jobs users hire Energy Efficiency to do. Not features, not screens, but outcomes.

Operational covers the daily rhythm of detecting, monitoring, tracking, and proving. Analytical covers investigation sessions: root cause, comparison, pattern discovery, insight packaging.

Every one of these jobs assumes IDM 2.0 as the underlying spine, so interval data, asset context, and audit IP show up in the same place. In both modes, Sera is the primary interface.

1

Detect anomalies OPERATIONAL

When responsible for energy performance across sites, know immediately if something is consuming abnormally, so problems can be addressed before they become costly. Powered by continuous IDM 2.0 interval data, not periodic exports.

2

Monitor performance OPERATIONAL

When managing daily operations, see real-time consumption against expected baselines, so deviations are caught early. Baselines and live readings sit on the same IDM spine.

3

Identify waste OPERATIONAL

When reviewing a facility's energy profile, pinpoint where energy is consumed unnecessarily, so savings opportunities can be quantified and prioritized using IDM-grade submeter and asset context.

4

Validate data quality OPERATIONAL

When making decisions based on energy data, confirm readings are complete and accurate, so action is taken with confidence and audit-ready records are maintained. IDM 2.0 makes quality status visible in-product, not in a separate tool.

5

Track against targets OPERATIONAL

When managing energy reduction commitments, track performance against targets continuously, so drift is corrected early and compliance

6

Diagnose root cause ANALYTICAL

When detecting an anomaly or unexpected consumption pattern, understand the root cause quickly by letting Sera reason over IDM

can be proven against the same IDM-backed numbers used everywhere else.

telemetry plus asset and ECM context, so the right corrective action is taken.

7

Compare performance ANALYTICAL

When evaluating a site's performance, compare it fairly against similar sites or time periods using a shared IDM-grade baseline, so real underperformance is distinguished from expected variation.

8

Discover patterns ANALYTICAL

When managing energy across a portfolio over time, surface slow drifts and seasonal patterns not visible day-to-day. IDM 2.0 keeps the history queryable so problems are caught early and structural improvements identified.

9

Drive action from insights ANALYTICAL

When an insight is worth acting on, package it into a clear deliverable for the right audience, so decisions are driven from leadership, finance, or operations, backed by traceable IDM evidence.

10

Manage action plans and follow-through ANALYTICAL

When committing to an energy improvement, track action items, site-level progress, and target attainment against IDM-measured outcomes, so follow-through is ensured and continuous improvement is provable. Validated by SE Corporate. Absent from RA Classic.

11

Prioritize across portfolio ANALYTICAL

When responsible for multiple sites, know which buildings need attention most urgently using portfolio-wide IDM signals, so time is spent where it has the greatest impact.

12

Bring interval data into the workflow OPERATIONAL

When working in RA+, expect IDM 2.0 telemetry, asset context, and audit IP in the same screens, with no module hop, no spreadsheet export, and no re-stitching by hand.

13

Reason over IDM with Sera ANALYTICAL

When investigating a question, ask Sera in natural language and have it reason over the IDM-backed context layer, blending telemetry with field and consultancy work product.

✦ **Where ECMs fit.** ECM identification is not a separate job. It is what happens when jobs 3, 6, and 8 are done well with IDM-grade data and good AI. Customers do not ask for ECMs. They ask Sera to find waste, explain anomalies, and show patterns. The output of those conversations, grounded in the IDM 2.0 spine, is an ECM.

FOUNDATION

Strategic Pillars

Three interconnected pillars defining the qualitative outcomes we commit to.
Quantitative KPIs live in **Success Looks Like**.

Productivity Gains

For the efficiency team

Upsell Engine

For advanced audit projects

Recurring RA+ Revenue

"We turn efficiency expertise into repeatable operating models, guided workflows, and structured deliverables that improve team effectiveness across the customer journey, all running on the IDM 2.0 data spine."

Lower cost to serve and higher delivery capacity. The strategy standardizes assessment methods, customer context, calculations, and deliverables on top of a shared IDM 2.0 spine so teams move faster with more consistent outputs.

What Lives Here:

- ✓ Faster assessments through standardized methods, assumptions, and defaults
- ✓ Consistent calculations, assumptions, and outputs across engagements
- ✓ Structured, visual audit deliverables generated in the platform from IDM-grade data
- ✓ Less rework, less manual slide building, higher throughput per auditor

"We intentionally expose selected expert content (e.g. ECMs) and early advisory inside RA+, powered by IDM 2.0 interval data, to create demand for deeper, paid audit engagements."

Higher conversion to advanced efficiency engagements and better qualified pipeline for the efficiency team. By exposing credible early guidance grounded in IDM-grade telemetry, customers see the value of deeper analysis, creating pull for expert services.

What Lives Here:

- ✓ Always-on identification of high-potential efficiency opportunities from IDM 2.0 interval data
- ✓ Clear visibility into what deeper analysis would unlock
- ✓ In-product calls to action to request advanced audits or detailed studies
- ✓ Pre-filled context and assumptions from the IDM spine when an audit is quoted or launched

Through in-product efficiency advice

"We productize early-stage efficiency insights as part of the RA+ experience, with IDM 2.0 as the continuous data layer that turns telemetry into ongoing value beyond one-off audits."

Recurring revenue justified by continuous efficiency guidance, not just reporting. With IDM 2.0 as the native spine, RA+ shifts from one-off audit value to ongoing advisory value, creating stronger platform stickiness and differentiation.

What Lives Here:

- ✓ Continuous, contextual efficiency recommendations inside the platform
- ✓ Value delivered even without a full on-site audit, on top of live IDM 2.0 data
- ✓ A shift from one-off audit value to ongoing advisory value
- ✓ Stronger platform stickiness and differentiation through IDM as the

- ✓ Centralized client context across sites, audits, and recommendations on a single IDM spine

QUALITATIVE OUTCOMES

Audits completed faster with higher consistency

Reduced time to quote for efficiency engagements

Lower cost to serve per audit

Higher throughput per auditor

- ✓ Seamless path from early IDM-driven insight to expert engagement

QUALITATIVE OUTCOMES

Increased upsell rate from early advisory to advanced audits

Better audit win rates

Shorter sales cycles for audits

Higher qualified pipeline from in-product prompts

agent-ready spine

- ✓ Give Me, Help Me, and Do It For Me engagement profiles on a single IDM-powered platform
- ✓ Goal-to-action recommendations integrated in Strategy module

QUALITATIVE OUTCOMES

Measurable adoption of in-product efficiency recommendations

Tangible contribution to RA+ recurring revenue

Platform stickiness improvement

Customer self-service engagement rates

GOALS & KEY RESULTS

Key Objectives

Customer-outcome focused objectives that frame the Beyond ECM Library transformation

01

⚡ Automation

Compress ECM audit cycle time with AI agents

02

🔍 Discovery

Surface always-on efficiency opportunities inside RA+

03

📖 Knowledge

Turn legacy audit IP into a reusable knowledge engine

O4

Platform (IDM 2.0)

Anchor efficiency on the RA+ / IDM 2.0 data spine

CURRENT STATE & VISION

Efficiency Technology Landscape

Where we are today, what the market demands, and how IDM becomes the RA+ data backbone.

⚡ IDM as the RA+ Data Backbone

IDM gives RA+ the trusted interval-data system of record to connect cloud, BMS, meter, cost, carbon, and operational signals with expert efficiency knowledge.

STEP ZERO

Signal where action is needed

Interval data reveals performance gaps before a full audit is launched.

STEP LAST

Prove what changed

After actions are taken, IDM tracks performance against baselines and keeps customers connected to outcomes.

🎯 *A credible trigger for expert review and targeted action.*

🎯 *Continuous proof and a path into the next improvement cycle.*

🏗️ *The RA+ opportunity is not a reporting migration or visual lift-over. It is turning proven Global Energy Bureau and IDM capabilities into shared platform intelligence that guides decisions, prioritization, and continuous improvement.*

24/7

Performance

Always-on energy and carbon
view

Data Ingestion

- Utility, cloud platform, BMS, meter, PME, EBO, and external-source intake
- Multiple stream stitching, reprocessing, and normalization
- Cumulative to interval conversion
- Data validation routines and bulk editing
- Patch-on-the-fly data quality
- Connectivity monitoring tools

Analysis & Intelligence

- Modeling and baseline engine (bulk creation in seconds)
- Energy forecasting and scenario models
- Comprehensive weather integration
- Marginal emissions rates and emissions library
- Tag and hierarchy-based aggregation
- Alerting, notification, and smart anomaly detection

M&V and Outcomes

- M&V workflows that measure, verify, and explain whether efficiency actions delivered expected performance outcomes
- IPMVP-compliant baseline creation using recognized measurement and verification methods for credible savings claims
- Actual vs. baseline and cumulative savings tracking across cost, energy, and emissions outcomes
- EnPI models that normalize performance indicators for weather, occupancy, production, or operating conditions to support ISO 50001
- Multiple baselines per data stream
- Performance deviation detection
- Investment protection and verification

BMS Integration: Bypass the Submeter Install

The biggest IDM adoption blocker is the cost and lead time of installing submeters. Many customers refuse upfront. BMS connectivity removes that barrier.

No hardware install

Pull existing meter data directly from the building management system.

Faster time to insight

Days, not months. No procurement cycle, no electrician on site.

Wider addressable base

Unlocks customers who have BMS but no Schneider submetering footprint.

Cross-business synergy

Direct hook into Schneider Digital Energy BMS estate; reuses existing data flows.

Fallback: Where BMS is absent, utility meter feeds (UK half-hourly, EU 5/15-min) still provide a baseline IDM experience. Submeter install becomes an upsell, not a prerequisite.

Internal Tools & Agents

IDM

Interval Data Management: trusted energy data from cloud platforms, BMS, meters, and external sources into a single system of record

⊗ Core data services are not yet fully native to RA+ opportunity discovery

ACT

Action tracking and project management for efficiency measures

⊗ Disconnected from efficiency recommendations

RA Classic

Resource Advisor: portfolio reporting, benchmarking, target setting

⊗ Reporting-focused, no actionable efficiency layer

Variance Check Agent

Automated variance detection between metered and billed consumption

⊗ Reactive analysis, not predictive

🎯 Competitive Landscape

Segment-focused leaders are investing in AI workflows and acquisitions to deepen their action layer.

Deepki

EU FOCUSED

ESG data intelligence, energy monitoring, and advisory for commercial real estate

⚠️ Segment-focused with AI workflow investments

Measurabl

GLOBAL

ESG software for CRE with asset-level data and fault detection. Acquired Hatch (submetering).

⚠️ Strong industrial AI and optimization capabilities

ENTO

EU FOCUSED

Energy monitoring and automated recommendations with optimization focus

⚠️ Automated recommendation engine competing with advisory

Snowflake / Palantir

GLOBAL

Data services and analytics platforms with increasing energy partnerships

⚠️ Commoditizing the data layer underneath energy platforms

↗️ Market Trends & Signals

→ AI fueling expectations for intelligent, agentic energy management

→ Data access and integrity are now vital, not optional

- Performance projects shifting toward right-sized M&V, with full verification reserved for Energy as a Service (EaaS), where savings help fund ongoing service fees, Infrastructure as a Service (IaaS), where efficiency outcomes support financed upgrades, and other higher-risk commitments
- Increasing desire for interval data for compliance and reporting (accountability)
- Increasing need for cross-domain expertise: site systems, data analysts, control strategy
- Segment-focused leaders investing in competitor platforms for AI workflows
- Lack of cost-competitive metering packages limiting growth in US and AUS

ENERGY AS A SERVICE

EaaS

A service model where the customer pays for delivered energy outcomes rather than managing every upgrade as a standalone capital project.

Typical outcomes

- ✓ Lower energy spend
- ✓ Operational performance improvement
- ✓ Ongoing optimization service

Data needs

- 📖 Utility and interval meter data
- 📖 Tariffs and site operating schedules
- 📖 Baseline drivers such as weather and occupancy

Verification level

INFRASTRUCTURE AS A SERVICE

IaaS

A financed infrastructure model where upgrades are delivered as a managed service and repaid through committed value or operational benefits.

Typical outcomes

- ✓ Funded equipment modernization
- ✓ Risk-managed capital avoidance
- ✓ Longer-term asset performance

Data needs

- 📖 Asset condition and project scope
- 📖 Capex and maintenance assumptions
- 📖 Post-install performance and uptime data

Verification level

Higher. Savings need to be credible enough to support recurring service fees and performance accountability.

Highest for large commitments. Verification must connect upgrade performance to the financed value case over time.

Known Market & Industry Constraints

-  Trust is essential: advice must be labeled as guidance, not commitment
-  Measures requiring licensed engineering need clear expert escalation paths
-  Safety notices mandatory where physical changes are involved
-  Savings and costs must show ranges with confidence levels
-  Audit trails required for all advice shown and inputs used

CAPABILITY FRAMEWORK

Efficiency Capability Mapping

Mapping efficiency capabilities to sales, pre-sales, delivery, and customer journeys to improve team productivity, structure deliverables, expose expert advisory for

upsell, and centralize client context

End-to-End Journey Integration

This capability mapping ties your ambition to improve auditor productivity, structure deliverables inside the platform, expose expert advisory for upsell, and centralize client context that accelerates quotations and assessments across every stage of the customer journey.

REGIONAL REALITY CHECK

Regional Journey Comparison

There is no single efficiency journey. Each region and sector enters, delivers, and monetizes differently. The platform must support flexible entry and exit points rather than force one path.

● Core ● Light ● Optional ● Out

Journey Stage	 Europe Knowledge-led on-site audits	 US Public Sector Performance contracts, ~\$400M revenue	 US Private Sector Commercial audits + implementation	 IDM (Data-Driven) Step zero or step last
01 Lead Intake	✓ 80% are net-new, not in any Schneider system	✓ RFPs, long sales cycles, commercial buildings	✓ Direct enterprise accounts	○ Existing RA customers with submeters or BMS feeds
02 Data Collection	✓ Pre-analysis from utility data; submeters rare	✓ Often pulled from BMS or utility records	✓ BMS pulls and utility data common	✓ 5/15/30-min interval data; 4,800+ meters today

Journey Stage	 Europe Knowledge-led on-site audits	 US Public Sector Performance contracts, ~\$400M revenue	 US Private Sector Commercial audits + implementation	 IDM (Data-Driven) Step zero or step last
03 On-Site Audit	 Auditor visits, notes, photos, floor plans (Akita Box rolling out)	 Fast-track assessments to scope the project	 Field audits feed design phase	 No site visits; pure data analysis
04 Analysis & Guidance	 Manual today; Knowledge base and ingestion engine in build	 Detailed design phase follows the audit	 27 TB of historic audit data exists, scattered	 Anomaly detection, benchmarks, alerts
05 Recommendations	 PPT deliverable is THE selling point	 Internal artifact, not the deliverable	 Internal artifact, not the deliverable	 Triggers next-step audit referral
06 Implementation	 Out of scope; customer or 3rd party executes	 MAIN revenue driver; SE installs the measures	 Core delivery model	 Hand-off to efficiency teams
07 Monitoring	 Light IDM hookup if submeters are installed later	 Contractual M&V; the natural RA+ meeting point	 Post-install tracking; RA+ candidate	 Continuous post-implementation verification

 Europe

Expertise, know-how, polished deliverables

Strong growth pipeline

 US Public Sector

End-to-end delivery with guaranteed savings

Largest single stream for SE Sustainability advisory

 US Private Sector

Audit + design + build + verify

Significant, paired with public sector

 IDM (Data-Driven)

Granular interval data spots anomalies automatically

Pre-step or post-step to the audit business

 Where journeys converge

MONITORING

All four journeys can meet on the monitoring layer. RA+ becomes the shared backend for interval data, M&V, and continuous insight, regardless of how the customer first arrived.

 Where they diverge

Implementation. US Public and US Private own implementation; Europe and IDM stop at recommendations or hand-off.

Deliverable. Europe sells the polished PPT recommendation. US sells the installed savings. IDM sells the alert.

"Build a flexible journey where customers enter and exit at any step. Shared backend, region-conditional UX. Do not force one umbrella."

Site visit. Europe and US require boots on the ground. IDM never does.

OPERATING MODEL

Experts Supported by Software

We are not a software vendor and we are not a pure consultancy. We are experts supported by software, humans on point for judgment, software on point for scale.

Expert Auditors **JUDGMENT, ENGINEERING, CLIENT RELATIONSHIPS**

Senior energy engineers, ECM specialists, and sustainability advisors who own the recommendation and the customer conversation, working from IDM 2.0 interval data and asset context inside RA+.

Agentic AI Assistants **CO-PILOTS THAT COMPRESS AUDIT HOURS INTO MINUTES**

Purpose-built agents (Sera and peers) that reason over the IDM 2.0 spine plus legacy audits, draft ROM estimates, stack measures, and explain assumptions so experts focus on calibration and trade-offs.

Automation Engine PARAMETRIC EFFICIENCY AT SCALE

Templated ECM calculations, sensitivity sweeps, CPQ handoffs, and M&V scaffolding generated automatically from IDM 2.0 interval telemetry, asset, and tariff data — with always-on detection between formal audit cycles.

IDM 2.0 Data Spine AGENT-READY TELEMETRY + WORK PRODUCT, NATIVE TO RA+

IDM re-platformed as a native RA+ capability: resolves building identity, ingests interval meter and asset data, blends in field/consultancy work product, and exposes one enriched context layer to experts and agents — no module hop.

Operating Principles

- ✓ Software absorbs the repeatable work; auditors own the judgment calls
- ✓ Agents are accountable to humans; humans are accountable to clients; IDM-grade data is accountable to both
- ✓ Every service line shares the same IDM 2.0 spine — interval data, asset context, and audit IP in one place, no swivel-chair handoffs
- ✓ Automation targets 90%+ of recurring ECM scoping touches over the horizon, powered by always-on IDM 2.0 discovery

EXPERTS IN THE SYSTEM

Consulting & Bureau on the RA+ Spine

Consulting and the Global Energy Bureau are part of the system, not a layer on top. They enrich IDM with audit and engineering context, validate Sera outputs, frame risk, and own change management and program oversight across the ECM lifecycle.

Self-Serve Operator

FULL AUTONOMY, AI-DRIVEN

Wants the keys. Runs IDM 2.0 analytics, explores ECM candidates, and acts on Sera recommendations directly. The platform must stand on its own, with the same data and explainability the experts use.

- ✦ Self-directed exploration of IDM 2.0 WAGES, asset context, and benchmarks
- ✦ Agent-led prioritization, KPI explainability, and recurring-question workflows
- ✦ Consulting and Bureau available a-la-carte for validation or complex calls

Guided Decision Client

EXPERTS IN THE SYSTEM

Wants Consulting and Bureau embedded in the workflow, not just on call. The platform drives the day-to-day; experts validate, enrich context, frame risk, and oversee execution on high-stakes calls.

- ✦ Consulting co-pilots ECM lifecycle decisions inside the same RA+ workspace
- ✦ Bureau owns ongoing monitoring, validation, and change-management cadence
- ✦ Findings flow back into IDM as enriched context for the next workflow

How Consulting & Bureau Show Up in the System

Data integration & auditing

Consulting and Bureau bring audit findings, engineering assumptions, and field measurements into IDM as first-class data, so the platform reasons on the same context the experts do.

Validation

Experts pressure-test baselines, ECM candidates, and Sera outputs against engineering reality before they become commitments. Site validation remains required for ECM design and capital decisions.

Interpretation & risk translation

Turn IDM signals into a clear portfolio narrative, with downside, tenant impact, compliance exposure, and execution risk framed for capital and operational decisions.

Change management & program oversight

Bureau and Consulting carry change management, stakeholder communication, and program oversight across the ECM lifecycle, with closed-loop validation tracked in the platform.

Engagement Tiers on One RA+ Spine

TIER	BEST FOR	CADENCE	HUMAN ROLE	PLATFORM / IDM 2.0
Self-Serve	Self-Serve Operator	On demand	Consulting or Bureau available a-la-carte for validation	Full RA+ + IDM 2.0 + Sera autonomy on the connected spine
Assisted	Mixed maturity	Async reviews + recurring touchpoints	Experts validate outputs, enrich IDM context, and co-own complex calls	Shared RA+ workspace with annotated readouts and ECM lifecycle tracking

TIER	BEST FOR	CADENCE	HUMAN ROLE	PLATFORM / IDM 2.0
Embedded	Guided Decision Client	Embedded engagement	Consulting + Bureau embedded across audit, ECM lifecycle, validation, and program oversight	Co-piloted RA+ spine with continuous Bureau monitoring and expert IP layered in

One connected spine. Clients move between tiers without losing context, history, or validation continuity. Engineering judgment and site validation remain required wherever ECM design or capital commitments are at stake.

SEQUENCING · AXIS: OVER TIME

Phasing: Three No-Regret Moves

A clear order of operations for the Energy Efficiency build inside RA+. IDM first, then ECM Library, then AkitaBox.

🕒 IN FLIGHT

PHASE 1

IDM Evolution

Urgent, no-regret

TIMING

MVP target Q4 2025 / Q1 2026

Not a lift-and-shift. Re-platform IDM into RA+ to drive market differentiation through agentic capabilities, richer context, and SaaS-ready delivery.

Why this, why now

- ✓ Closes a competitive gap that becomes urgent if left unaddressed
- ✓ Anchored by SE Corporate as RA Classic client and design partner
- ✓ Aligned to SE Corporate RA+ go-live in early Q1 2027
- ✓ Embeds into the broader efficiency workflow, not a standalone module

✓ ADJACENT STRATEGIC

PHASE 2

ECM Library

Cross-COE feeder

TIMING

Sequenced with Pricing & Savings Accelerator

ECM Library is a feeder for many capabilities across RA+. It connects construction services, consultancy, and the energy efficiency product into one knowledge backbone.

Why this, why now

- ✓ Connects efficiency, consultancy, and construction services
- ✓ Strong overlap in mindset with the Pricing & Savings Accelerator data hub
- ✓ Powers Sera reasoning with codified measures, assumptions, and outcomes
- ✓ Reuses data patterns established by IDM in Phase 1

🕒 OPEN QUESTION

PHASE 3

AkitaBox

Build vs. integrate decision

TIMING

Sequencing TBD

AkitaBox is a no-regret strategic move, but the shape is undefined. Open questions: do we build, and if so, inside RA+ or as a separate module?

Why this, why now

- ✓ Confirmed as one of three no-regret strategic moves
- ✓ Build vs. partner vs. integrate not yet decided
- ✓ Surface area within RA+ vs. standalone module to be scoped
- ✓ Differentiation vs. adjacent S&S products (BDP, Foresight) must be clear

SEQUENCING LOGIC

Foundation for Phase 2 and 3. Sets the data, agent, and context patterns reused downstream.

SEQUENCING LOGIC

Builds on the IDM data foundation. Co-evolves with the Pricing & Savings Accelerator workstream.

SEQUENCING LOGIC

Sequencing depends on IDM and ECM groundwork plus a clearer commercial case.

PHASE 1 DEEP DIVE · AXIS: CLIENT AUTONOMY

IDM 2.0 Vision

Re-platform IDM into RA+ as the trusted, connected foundation for WAGES and contextual data, enriched continuously by Consulting and Bureau, and exposed to Sera for explainable workflows.

IDM 2.0 is the connected spine that ties WAGES, asset context, audit findings, Bureau insights, and validated outcomes into one explainable system. Sera turns that combined

data and context into prioritization, structured execution, and closed-loop validation, with engineering judgment always in the loop for complex calls.

Core Use Cases

Prioritization Across the Portfolio

Surface where to act first across sites, systems, and portfolios using WAGES, asset context, and Bureau-enriched insights on the same spine.

Automated Insights & KPI Explainability

Generate readouts where each KPI links back to the underlying data, assumptions, and engineering context, so customers see why a number moved, not just that it did.

ECM Detection (with Engineering Judgment)

Detect likely ECM candidates from interval data and asset context. Detection is a starting point, not a proposal. Engineering judgment and site validation remain required to qualify, design, and commit.

Recurring-Question Workflows

Codify the recurring questions efficiency teams answer (anomalies, baselines, what changed, what to do,

Context Enrichment from Consulting & Bureau

Capture audit findings, Bureau monitoring notes, engineering

Closed-Loop Validation

Track and verify outcomes using the same underlying data that surfaced the opportunity, IPMVP-aligned, with

what is the risk, who owns it, was it verified) into structured loops inside Sera and IDM.

assumptions, and validation outcomes as first-class data inside IDM so the next workflow inherits the full context.

Bureau in the loop where ongoing monitoring is part of the engagement.

Client Engagement Profiles

One platform, three ways to consume it. Designed to open new market segments we cannot serve today.

FULL SELF-SERVE

Give Me

Clients with internal expertise who want to run analyses, configure KPIs, and manage their own program inside RA+, using the same IDM data and explainability the experts use.

HYBRID

Help Me

Clients who want platform autonomy for daily work plus Consulting or Bureau expertise for complex moments (audits, ECM design, validation, change management).

FULL SERVICE

Do It For Me

Clients who rely on Schneider for data integration, KPI configuration, audit, ECM lifecycle, and program oversight, all running on the same connected RA+ spine.

DEFENSIBILITY

The Moat

Telemetry alone gets commoditized as reasoning matures. Our edge is the on-premise context that pure software players cannot reach.

✓ Bring WAGES, asset, ECM, audit, and Bureau context onto one spine, not just telemetry

✓ Expose the enriched context to Sera so prioritization and explainability are grounded, not generic

✓ Right to win comes from data plus expertise plus continuous validation, not software alone

✓ Make Consulting and Bureau work product first-class data inside IDM

✓ Use the same data end-to-end: from detection to design to validation

Design Principles

New capabilities, not faster sameness

Take advantage of the agentic framework and new RA+ primitives. Replicating IDM cheaper is not the goal.

Embedded, not bolted on

IDM 2.0 is an integral part of the efficiency workflow inside RA+, not a standalone tab at the end of the journey.

Differentiated within S&S

Clearly defensible against adjacent S&S products (BDP, Foresight) so re-platforming is justified in budget reviews.

Anchored on real users

Validate scope with SE Corporate as design partner plus a small set of industrial clients (Alfa Laval, OP Mobility, Velux, Tetra Pak, Sanofi).

QUANTITATIVE KPIS

Success Looks Like

Five measurable indicators that translate the Strategic Pillars into trackable signals.
Each KPI defines what we measure, not a committed target.

The signal is
simple: more
qualified work,
delivered with less
friction.

THROUGHPUT

Audit Cycle Time

Average days from kickoff to deliverable, tracked per audit type.

Days per audit (trend)

Success should show up in team productivity, stronger expert advisory pull, and recurring RA+ engagement without relying on one-off delivery artifacts.

01

PRODUCTIVITY

02

UPSELL

03

REVENUE

CONVERSION RATE

Advisory-to-Audit Conversion

Share of in-product advisory prompts that convert into a paid advanced audit.

% prompts → audits

SALES VELOCITY

Time to Quote

Median hours from opportunity identification to signed quote for efficiency engagements.

Hours to quote (median)

ENGAGEMENT

Recommendation Adoption

Share of in-product efficiency recommendations acted on by RA+ users within 90 days.

% recs actioned (90d)

BUSINESS IMPACT

RA+ Revenue Contribution

Recurring revenue attributable to efficiency features as a share of RA+ ARR.

% of RA+ ARR

✧ SERA INTERFACE SIGNALS

Sera-specific signals confirm that the interface is producing real daily value, not just dashboards.

Morning briefings consumed

Energy Managers open the daily briefing as part of their routine

Anomaly narration accuracy

Sera explanations of anomalies are confirmed as useful by Data Ops

Alert top-3 prioritization

Top-3 alerts are acted on, lower-priority noise stays suppressed

Target risk prognosis use

Sustainability Leads use forward-looking target risk views in reviews

Action plan attainment

Action plans created in Sera reach committed completion rates

TRANSFORMATION

Start / Stop Matrix

The behaviors and practices we're leaving behind, and the new approaches we're embracing.

Theme	✗ Stop Doing	✓ Start Doing
 Audit Workflows	✗ Manual workflows and PowerPoint deliverables that don't scale	✓ Structured, digital audit workflows with platform-native deliverables
 Client Context	✗ Fragmented across tools and documents, recreated for each engagement	✓ Centralized once and reused across audits, quotes, and follow-ups
 Expert Advisory	✗ Delivered late in the cycle and does not scale beyond individual consultants	✓ Exposed early in-product to create pull for advanced audit projects
 Recurring Value	✗ One-off audit value with no ongoing customer touchpoint	✓ Continuous efficiency guidance that supports RA+ recurring revenue
 Opportunity Discovery	✗ Customers wait for full audit to learn what's possible	✓ Early, credible efficiency advice visible directly in RA+
 Audit Deliverables	✗ Slide-driven processes requiring manual assembly	✓ Structured, visual, interactive deliverables generated in platform
 Efficiency Recommendations	✗ Static guidance that requires expert interpretation	✓ Actionable capabilities with transparent assumptions and confidence levels

Continuous
Improvement

Delivered audits are isolated, not
feeding back into system

Every audit improves future
recommendations through M&V
feedback

Old Ways → New Normal

✦ Executive Takeaway

Energy Efficiency as a **platform capability**, with Sera as the interface and IDM as the foundation.

Moving from siloed RA Classic modules to a governed RA+ platform turns Bureau expertise into a continuous, in-product experience. Energy Managers act daily, Data

Ops investigate deeply, Sustainability reports with confidence, and Executives see the value, all on one foundation.

Back to Top ↑

© 2026 Efficiency Transformation • Efficiency Transformation with RA+ • Internal Only and Confidential

APPENDIX

Efficiency Transformation Details

Deep dive into the operating model, capability evolution, quarterly plans, and supporting metrics.

✕ Collapse all

Meet Customers Where They Are, Pull Them Up

↗ CUSTOMER MATURITY LADDER · AXIS: CAPABILITY DEPTH

Meet Customers Where They Are, Pull Them Up

Customer maturity progresses through four stages. RA+ Energy Efficiency must meet customers where they are and pull them up the ladder over time.

01

STAGE 1

Accountability

Customers know who owns what, can see consumption by site or business unit, and have a baseline they trust.

02

STAGE 2

Cost Allocation

Energy and carbon are allocated cleanly to cost centers and tenants, enabling chargeback and clear ownership of spend.

03

STAGE 3

Performance Management

Targets, baselines, and variances are tracked continuously. Anomalies and drift are surfaced before they become problems.

04

STAGE 4

Optimization

Customers act on prioritized recommendations, manage action plans, and verify outcomes through M&V loops.

This ladder is a customer maturity lens, not a pricing or commercial-tiering model.

GUARDRAILS

Where We Stop, How We Operate

BOUNDARIES & OPERATING RULES

Where We Stop, How We Operate

The boundary list keeps scope honest. The operating rules keep customer-facing advice trustworthy.

BOUNDARY LIST

Out of Scope

Contractual Guarantees

Performance guarantees and contractual commitments require separate validation

OPERATING RULES

Guardrails

Transparency & Scope

- ✓ Label advice as guidance, not a commercial commitment
- ✓ Show savings as ranges with confidence levels and data freshness

Detailed Engineering

Detailed engineering design without expert validation stays outside scope

Asset Planning

Baseline modeling, M&V workflows, and capital planning are covered in a separate Asset Planning discovery, not in this playbook

- ✓ Display key assumptions and any data gaps

Data Quality & Applicability

- ✓ Enforce minimum data checks before showing estimates
- ✓ Display applicability rules, blockers, and prerequisites
- ✓ Filter recommendations by geography, segment, and asset tags

Risk & Compliance

- ✓ No auto-suggest for measures requiring licensed engineering sign-off
- ✓ Maintain audit trails of advice shown and inputs used
- ✓ Link to standards and incentives without legal interpretations

User Experience & Escalation

- ✓ Offer a path to request expert help from any advice card
- ✓ Provide rationale snippets and similar-site evidence
- ✓ Allow users to reject or snooze recommendations

Why Now, Why This Way

WHY NOW, WHY THIS WAY

Strategic Context

Three forces shape why this strategy matters now: the RA+ platform transition, proven Efficiency CoE delivery strength, and the need to convert trusted interval data into guided action.

RA+ Platform Transition

STRATEGIC WINDOW

2027 - 2028

IDM and the broader efficiency capability should evolve into RA+ as shared platform intelligence, not just a migrated interface.

CoE capability scale

Turn proven consulting, implementation, IDM, and Global

Phased evolution

Start with continuity and efficiency guidance, then layer

Customer continuity

Protect existing customers while RA+ becomes the broader home

Clear governance

Align product, data, engineering, and domain experts around the

Energy Bureau capabilities into RA+ services where they create platform leverage.

deeper automation and reasoning.

for performance management and continuous improvement.

same transition choices.

Two Customer Archetypes

The efficiency team serves two very different buyers. The platform must respect both, not collapse them into one experience.

Traditional Audit Customer

Cold case, fast turnaround, PPT deliverable

TRADITIONAL AUDIT DEMAND

WHAT THEY WANT

- Quick on-site audit, no installs
- Polished recommendation deck
- Expert know-how, not a tool
- In and out, no ongoing platform commitment

⚠ Risk. If we force them onto a platform, we lose the deal. Self-serve adoption is unrealistic.

⚖ Platform fit. Internal productivity tool only (to start). Auditors use the platform; the customer never sees it.

Enterprise Strategic Account

Inditex, Amazon and similar global accounts

HIGHEST GROWTH, HIGHEST VISIBILITY

WHAT THEY WANT

- Integrated, always-on platform across sites
- Live dashboards, granular data, audit trail
- Self-serve exploration with expert support
- A reference story they can cite internally

⚠ Risk. A PPT-only deliverable underwhelms them. Without RA+, they will look at competitors, or build it themselves.

⚖ Platform fit. Full RA+ deployment with services wrapped around the platform.

"The strategy must serve both realities: some customers still need an expert-led audit deliverable, while strategic accounts increasingly expect an always-on performance platform."

Intelligent Performance Tailwind

MARKET PULL

Customers increasingly expect energy, cost, carbon, and operational performance to be connected in one intelligent experience. High-quality interval data becomes the foundation for that shift.

Interval data becomes table stakes

Annual or monthly utility totals will not satisfy executive expectations for timely performance decisions.

IDM role strengthens

IDM becomes the trusted system of record behind reporting, action guidance, and performance services.

Consulting-to-action path

Strategy, design, execution, and continuous improvement can operate as one guided RA+ journey.

BMS and meter data unlock scale

Existing operational data sources reduce friction and extend the addressable base before new hardware is required.

So what. Build IDM and the efficiency knowledge base connection so they natively serve energy, carbon, resilience, and operational performance. The same data spine powers the full improvement cycle.

COMPETITIVE LANDSCAPE

Efficiency Technology Landscape

COMPETITIVE LANDSCAPE

Serious Players, Differentiated Position

Credible competitors exist across advisory, ESCO, and OEM platform plays. Our differentiator is governed CoE expertise paired with RA+ as a living efficiency engine.

ENGIE Impact

GLOBAL

Full-service sustainability and efficiency advisory with strong portfolio analytics, but interval data lives in their own stack rather than a customer-owned spine.

Ameresco

GLOBAL

Deep ESCO heritage with performance-contracted ECM delivery. Interval data is used to underwrite contracts, not exposed as an agent-ready layer customers can self-serve.

Johnson Controls (OpenBlue)

GLOBAL

OEM-backed building efficiency platform with strong telemetry, but ECM intelligence and audit IP remain in services, not codified in the product.

Siemens (Building X)

GLOBAL

Connected building platform with strong analytics on Siemens controls. Limited reach into non-Siemens IDM and third-party consultancy IP.

Cushman & Wakefield / JLL

GLOBAL

FM-led efficiency programs anchored in occupancy and lease data, but no native interval data spine and no agent layer over building telemetry.

Regional Energy Consultancies

REGIONAL

Specialist ECM auditors with deep local code and incentive knowledge, but no platform, no IDM, and no continuous data layer behind their deliverables.

Why We Win

Not just a consultancy. Not just a platform. A governed CoE capability inside RA+ that compounds value with every audit, every meter, and every customer.

✓ CoE expertise plus RA+ platform, not a slideware-only consultancy or a data-only tool

✓ IDM 2.0 re-platformed inside RA+ as the agent-ready interval data spine, not a siloed legacy tool

- ✓ Telemetry blended with field and consultancy work product, an on-premise context layer pure software players cannot reach
- ✓ Sera as a unified guided interface reasoning over IDM-grade data across Energy Managers, Data Ops, Sustainability, and Executives
- ✓ Sequenced for the Energy Manager first, with clear service boundaries between automated and expert work
- ✓ Decades of audit IP reactivated as structured, reusable ECM intelligence inside the product
- ✓ Three engagement profiles (Give Me, Help Me, Do It For Me) on a single IDM-powered platform, opening segments competitors cannot serve
- ✓ Continuous efficiency guidance between formal engagements, lifting RA+ stickiness and pull for advanced audits

DATA FOUNDATION

Data Required for Efficiency Capabilities

DATA FOUNDATION

Data Required for Efficiency Capabilities

Core data objects needed to power efficiency recommendations, enable structured deliverables, and surface credible efficiency advice across sales, delivery, and customer journeys.

✓ Required Data Objects

Efficiency Taxonomy

Systems, subsystems, and measure types

Default Assumptions

Standard values for calculations

Site Descriptors

Building type, geography, segment

Constraint Inputs

Budget, timeline, risk tolerance

Goal Mappings

Emissions targets to efficiency recommendations

Pattern Data

Similar site outcomes and evidence

M&V Outcomes

Measurement and verification results that compare actual post-project performance against an agreed baseline

Regulatory Links

Incentives and compliance requirements

+ Optional Site Context (High-Value)

Building Data

BMS and AkitaBox integrations

Energy Data

Interval consumption and costs

With This Data Foundation

- ✓ Surface site-relevant efficiency recommendations
- ✓ Generate data-light ROM ranges with confidence
- ✓ Apply stacking logic for opportunity interactions
- ✓ Pre-fill assumptions for audit quotes
- ✓ Enable continuous M&V feedback loop
- ✓ Power in-product efficiency advisory

 KNOWLEDGE ENGINE

Efficiency Knowledge Engine

TURNING LATENT IP INTO STRATEGY

Efficiency Knowledge Engine

27 TB of historic audit data sits in scattered SharePoints, desktops, and PPT decks across Schneider. The knowledge engine turns that latent IP into a structured, queryable strategy foundation that powers smart recommendations.

PPT Extraction Prototype

Built with the Data Science team.

01

Drop

Auditor drops a past audit PPT (Inditex, Amazon, public-sector deck) into the platform.

02

Extract

The engine reads the deck and auto-extracts key fields per opportunity: name, savings, unit of measure, payback, baseline, and scope.

03

Review

Original auditor confirms or edits the extracted data. Human-in-the-loop keeps quality high.

04

Ingest

Validated opportunities land in the central knowledge base, tagged by client, site type, sector, and geography.

Monte Carlo Top-5 Recommendations (to be considered for RA+)

Volume unlocks intelligence. Once we have tens of thousands of historic examples, we run probabilistic simulation to surface the right actions for the right client.

Inputs

- Client context: site type, sector, geography, climate zone
- Historic opportunity performance distributions including savings, payback, and cost ranges
- Available data quality signals from IDM, BMS, or utility feeds
- Constraints: budget, downtime tolerance, regulatory scope

Output

A ranked Top-5 opportunity shortlist per client, with probability-weighted savings, payback bands, and confidence intervals, not a pixel-perfect single number.

Why probabilistic? A measure might range from 20% to 140% payback depending on context. Monte Carlo embraces that uncertainty rather than hiding it, giving teams a defensible starting point in seconds.

✦ Enablers in motion

- Akita Box API feeds field notes, photos, and floor plans straight into the efficiency knowledge base.
- The knowledge base refresh becomes live as more auditors adopt Akita Box on tablets.
- Expert-in-the-loop validation step keeps the library clean as it scales.

🛡 Guardrails

- Never replace the auditor. Recommendations are a starting point, not the deliverable.
- Probability bands, not false precision. Show ranges and confidence, not single decimals.
- Customer-specific context always wins over portfolio averages.

🔗 ECM LIFECYCLE

Detect to Verification, on the RA+ Spine

✦ ECMs as a Lifecycle, not a Static Output

The platform structures and carries every ECM from detection through verification on the same RA+ spine. Click any stage to see what RA+ does, what experts do, and what flows in and out.

Detect **IN BUILD**

Surface ECM candidates from IDM data and asset context.

✦ RA+ DOES

RA+ scans WAGES data, asset registers, and operating context to surface candidate measures and rank them by signal strength.

👥 EXPERTS DO

Bureau and Consulting review candidates, discard noise, and add site-specific context the data cannot see.

📖 IDM INPUTS

- WAGES meters
- Asset register
- Operating schedule
- Climate / occupancy

✦ OUTPUTS

- Ranked candidate list
- Explainability trail
- Priority hotspots

🛡️ STAGE GUARDRAILS

- Candidates are hypotheses, not commitments
- Engineering judgment required before progressing

🛡️ Lifecycle guardrails

- ECMs are a lifecycle, not a static output
- Platform structures and carries the lifecycle · it never replaces audits or shortcuts proposals
- Engineering judgment and site validation required at every stage
- Same IDM data flows end-to-end · detection, design, and verification stay reconciled

📖 RA CLASSIC IDM CLIENT

SE Corporate Proof of Concept

SE Corporate: RA Classic IDM Client

4,800+

Meters connected

Electricity, gas, water, HVAC, lighting, IT, distribution, process lines, PV, generators

1,200

Monthly logins

62+ individual users with 10+ IDM sessions in the past 12 months

40+

Unique data systems

Many sites have 25+ interval streams pushing into monthly KPIs

243

Alerts and alarms

Configured across sites and systems, with 100s of dashboards

RA IDM scored 4.8 / 5 in the Energy Performance Training program, the highest-rated module (PME scored 3.3). Confirms the product works when users are enabled. The opportunity is making that enablement the default interface, not a paid service.

❗ RA CLASSIC PAIN INVENTORY

What the Efficiency Transformation Eliminates

RA Classic limitations that the platform shift eliminates. Every must-fix item stems from the module architecture: separate hierarchies, disconnected filters, siloed data.

P1 MUST FIX

Two competing data models

Standard RA bottoms out at Account; PAM goes deeper to locations, meters, nodes. Users do not know which world they are in.

P2 MUST FIX

Dashboard filters silently fail on PAM widgets

Division/Group and Data Stream filters do not affect PAM widgets. Users apply filters expecting everything to respond; PAM widgets stay unchanged.

P3 MUST FIX

5-step bridge to monthly reporting

To get a PAM measurement into a standard RA report: create PAM measurement, create RA stream, map via Site Mapping, enable import, wait for daily aggregation. Performed daily across 150+ sites.

P4 MUST FIX

Corrected data is not persisted

PAM corrections are computed on the fly. Only raw metered values are stored. No audit trail. Corrected values do not reach standard RA.

P5 MUST FIX

P6 MUST FIX

Spreadsheet-driven commissioning

Hierarchy Setup and Manual Meter Readings require generating an Excel template, editing offline, uploading, validating, applying. Drives Bureau onboarding timelines.

Separate report system

Interval Data Reports are saved PAM analyses packaged for email. Completely disconnected from standard RA Reporting.

📄 VOC VALIDATION

Customer Evidence

📄 VOC VALIDATION

Customer Evidence

Three external customer interviews plus SE Corporate evidence gathered through Bureau leadership. Both sources are treated as real evidence, clearly attributed.

PERSONA VALIDATION

High

3 clients across 4 personas

JTBD VALIDATION

High

Jobs 1, 3, 4, 5, 7, 8, 9 validated

AI-FIRST DEMAND

High

3/3 customers demand AI

ALERT FATIGUE RISK

High

All 3 flagged unprompted

Alfa Laval

Magnus Roth, Head of Global Sustainability

63 service centers, long-term RA Classic client

Reports go in the drawer. Automated daily and weekly hints are the #1 request.

Sera concept directly validated: pushed insights without requiring expertise.

Hierarchy UX is a blocker. Meter names are numeric codes.

Expansion blocked. 90% of 63 service centers are unconnected.

👏 *It does not have to be a thorough analysis, but more of a hint, because then you get it built into your daily work.*

Velux

Rasmus Sorensen and Maja Lewinska, Energy Program Lead and Global Sustainability Lead

~24 sites, ISO 50001 certified

Daily login confirmed. Rasmus uses RA daily, many times.

Diagnosis AND prognosis. AI must flag risk of missing targets.

ISO 50001 is the strategic driver. Standardized KPIs across all sites.

👏 *I need you to tell me if I am at risk of missing my targets. The diagnosis and the prognosis.*

Tetra Pak

Ramzi Cherad, Global Energy Program Lead

45 factories, 4,000+ meters

AI should find what humans spend months finding. Continuous, automatic detection.

Continuous, not historical. Catch anomalies when they start.

Competitive AI bypass risk. Users will route data through Copilot or Notebook LM if RA does not offer native AI.

Enterprise AI mandate. Tetra Pak requires every platform to incorporate AI.

🔗 *It is the continuous finding it when it happens. That is the important bit. Not historic.*

OPERATING MODEL

Strategy-to-Improvement Flywheel

The operating model that connects consulting, implementation, IDM, and continuous performance improvement in RA+

VEE: Validation, Estimation, and Editing

VEE is the trust layer that prepares meter and telemetry data before it informs analysis, recommendations, or performance claims.

The result is a cleaner, auditable data set that the efficiency workflow can trust before

STEP 01

Telemetry

Integrations plus VEE to make interval data reliable before it informs decisions

STEP 03

Design

Audits, baselines, business case inputs, and solution shaping from trusted context

STEP 02

Strategy

Portfolio priorities, KPI workshops, maturity assessment, and site prioritization

STEP 04

Execution

Workflow integration, project handoff, implementation support, and outcome tracking

moving into benchmarking, opportunity discovery, M&V, or EnPI modeling.

STEP 05 Output

Living reports, guided findings, audit deliverables, and executive narratives

STEP 06 Improve

Continuous optimization, performance services, and next-best recommendations

"The future platform advantage is not another dashboard. It is an intelligence layer that connects trusted signals, expert efficiency knowledge, implementation pathways, and site context so RA+ can move users from strategy to measurable improvement."

CAPABILITY EVOLUTION

Opportunity × Phase Matrix

How each capability evolves across delivery phases, from foundational database work to the full EE product.

#	Opportunity / Problem	Draft Knowledge Base	Data-Mining Project	NOW (Strategy Integration)	NEXT (Building View)	LATER (EE Product)
1	Shared efficiency language, taxonomy, and governance	✓ Defined first taxonomy, systems, subsystems, types	✓ Validates & enriches taxonomy with real examples	✓ Needed immediately	✓ Required for Building View	✓ Core always
2	Standardized data model (validation & DQA)	✓ Draft schema and required fields defined	✓ Data-mining exposes inconsistencies to fix	✓ Enforced for Strategy consumption	✓ Required for consistent filtering	✓ Required for all workflows

#	Opportunity / Problem	Draft Knowledge Base	Data-Mining Project	NOW (Strategy Integration)	NEXT (Building View)	LATER (EE Product)
3	Central Knowledge Base (Library UI)	✓ Draft opportunity set created	✓ Adds more examples for knowledge base population	✓ Knowledge base MVP used by Strategy	✓ Knowledge base used by Building View	✓ Extended with deeper metadata
4	Machine-readable guidance (programmatic access)	✓ Metadata definitions created	✓ Extracted metadata increases machine-readability	✓ Needed to expose guidance to Strategy	✓ Critical for Building View logic	✓ Mandatory for EE workflows & agents
5	Library ↔ Strategy service boundary	— Early thinking only	— Data-mining not directly relevant	✓ Main delivery in NOW	— Reused by Building View	— Reused later
6	Convert goals into actions	— Foundation only	— Knowledge base enrichment improves relevance	✓ Implemented in Strategy	— Indirectly reused	✗ Not used directly
7	Assumption defaults & prefill	✓ Identified needed fields	✓ Mined patterns help create default logic	— Light use possible	✓ Key relevance feature in Building View	✓ Full automation in EE product
8	Analysis scaffolding (per-opportunity guidance)	— Only conceptual	— Raw data helps understand common variables	✗	✗	✓ Implemented in EE product
9	Structured site capture (AkitaBox)	✗ Not addressed	✗ Not addressed	✗	✗	✓ Implemented in EE product
10	Presentation builder	✗	✗	✗	✗	✓ Implemented fully
11	M&V feedback loop	✗	— Partial: historical patterns help with	✗	✗	✓ Implemented when real

-  Recurring RA+ Revenue

TRACKING PROGRESS

Supporting Scorecard

Key metrics that measure our progress toward the Efficiency Transformation vision.

Efficiency Taxonomy	Knowledge Base Completeness % of core guidance patterns with metadata and assumptions	Service Boundaries Clean interfaces defined for Strategy and Building View
---------------------	--	---

Unified opportunity types, systems, assumptions, and governance standardized

Strategy Integration

Goal → action recommendations live in platform

Building View Coverage

% of site types with opportunity relevance logic

Guardrail Compliance

% of customer-facing advice meeting trust standards

REFERENCE

Glossary

Q Search terms (e.g. ECM, IPMVP, EaaS)...

ENERGY EFFICIENCY DOMAIN

ECM · Energy Conservation Measure

M&V · Measurement & Verification (IPMVP-aligned savings validation)

ROM · Rough Order of Magnitude (early-stage savings/cost estimate)

EnPI · Energy Performance Indicator

kWh / MWh / GJ · energy units

BAS · Building Automation System

EE · Energy Efficiency

IPMVP · International Performance Measurement & Verification Protocol

ROI · Return on Investment

EUI · Energy Use Intensity (kWh/sqft or kWh/m²)

HVAC · Heating, Ventilation & Air Conditioning

SERVICE / COMMERCIAL MODELS

EaaS · Energy as a Service

ESCO · Energy Service Company

EPC · Energy Performance Contract

PPA · Power Purchase Agreement

O&M · Operations & Maintenance

PRODUCT / DELIVERY

VOC · Voice of Customer

JTBD · Jobs To Be Done

OKR · Objectives & Key Results

PoC · Proof of Concept

SLA · Service Level Agreement
